

A.CED.A.1: Geometric Applications of Quadratics 3

- 1 Two floors, each square in form and one 7 feet wider than the other, contain together 1429 square feet. How many square feet in each?
- 2 The distance around a rectangular field is 100 rods; the area is 589 square rods. Find the length and breadth of the field.
- 3 The area of a rectangle is 48 sq. ft. Its perimeter (sum of its sides) is 32 feet. Find its length and width.
- 4 The length of a rectangular field is three times its width, and the number of square rods in its area is $7\frac{1}{2}$ times the number of rods around the field. Find its length and width.
- 5 The length of a certain rectangle is to its width as 8 to 5 and the number of square feet in its area is equal to the number of linear feet in its perimeter less three. Find its length and width.
- 6 The length of a floor exceeds its width by 2 feet. If each dimension is increased 2 feet the area of the floor will be increased 48 square feet. Find the dimensions of the floor.
- 7 The perimeter of a rectangular lot is 220 feet and its area is 2925 square feet. Find its length and breadth.
- 8 A rectangular yard is 20 rods longer than it is wide. Its area is 2400 square rods. Find the dimensions of the yard.
- 9 If the sides of an equilateral triangle are increased by 7 inches, 4 inches and 1 inch respectively, a right triangle is formed. Find the length of a side of the equilateral triangle.
