

NAME: \_\_\_\_\_

1. Given:  $\overline{VU} \cong \overline{ST}$  and  $\overline{SV} \cong \overline{TU}$   
Prove:  $VX = XT$

2. Given:  $\overline{SV} \cong \overline{TU}$  and  $\overline{SV} \parallel \overline{TU}$   
Prove:  $VX = XT$

3. Given:  $ABCD$  is a rhombus.  
Prove:  $\triangle BCA \cong \triangle DAC$

NAME: \_\_\_\_\_

4. Given that  $ABCD$  and  $EFGD$  are parallelograms and that  $D$  is the midpoint of  $\overline{CG}$  and  $\overline{AE}$ , prove that  $ABCD$  and  $EFGD$  are congruent.

5. Theorem 9-6 states that if one pair of opposite sides of a quadrilateral is congruent and parallel, the quadrilateral is a parallelogram. This condition is met in two quadrilaterals.  $\overline{AB}$  is parallel and congruent to  $\overline{DC}$  in  $ABCD$ ,  $\overline{EF}$  is parallel and congruent to  $\overline{HG}$  in  $EFGH$ , and  $\overline{AB} \cong \overline{EF}$ . Are the two quadrilaterals congruent?
6. To find the formula for the area of a trapezoid, you can rotate the trapezoid and place the image next to the original to make a parallelogram. Write a flow proof to show that the figure made from the two trapezoids is a parallelogram.

Check students' work. They should use the def. of midpoint and opposite sides of a parallelogram are  $\cong$  to show that  $\overline{AD} \cong \overline{DE} \cong \overline{FG} \cong \overline{BC}$  and  $\overline{GD} \cong \overline{DC} \cong \overline{AB} \cong \overline{EF}$ . Then, using the vert.  $\angle$  thm. and opposite  $\angle$ 's of a parallelogram are  $\cong$ , show that  $\angle GDE \cong \angle ADC \cong \angle B \cong \angle F$ .

[4]  $\angle G \cong \angle E \cong \angle C \cong \angle A$ , since opposite angles are = and add to  $360^\circ$  in a parallelogram. Therefore  $ABCD \cong EFGD$  because their corresponding sides and corresponding  $\angle$ 's  $\cong$ .

[5] No, the other two sides are not necessarily congruent. Check students' examples.

Check students' work. They should show that in trapezoid  $ABCD$ ,  $\overline{AB}$  and  $\overline{CD}$  are parallel, so  $\angle A$  and  $\angle D$  are supplementary. In the image  $A'B'C'D'$ ,  $\angle A \cong \angle A'$ , so  $\angle A'$  and  $\angle D$  are also supplementary. Hence,  $\overline{AD} \parallel \overline{A'D'}$ . Similarly, prove  $\overline{AD'} \parallel \overline{A'D}$ , so  $AD'A'D$  is a parallelogram.
